| Scientific Focus: | neuro-intensive care, metabolism and endocrinology, pain-agitation-delirium management, data mining |
| Key words: | neuro-intensive care, data mining |

What else do I want to say?

The Intensive Care E-Mentoring programme is a great initiative, and once more a demonstration of the dynamics and creativity that exist in such a lively way in this young and enthusiastic NEXT team. Things have changed quite a lot since I started my career as clinician and researcher. Most of my training was done at a national level, in my own country. I was fortunate to work with fantastic mentors and teachers, and still apply the lessons I have learned from them, in the many challenges I meet in my professional life. Nowadays, the world we live in has become much smaller. It is fascinating to see how young European ICU trainees and researchers are able to take advantage of that. As a potential ICE mentor, I hope to be able to contribute to the international career of my mentee. My vision on how we should turn this mentorship into a successful project can be summarized in two simple words: use me! I can offer you my national and international network and contacts, I will definitely invite you here in Leuven to visit our department and laboratory, I could assist you when applying for grants, I would be happy to review your research projects, if you want I can assist in drafting your manuscripts in preparation, ... Personally, I see this mentor-mentee relationship as something very dynamic and interactive, and I would like to invite my potential future mentee to develop this together with me. I look forward to receive your profile! If possible, similar research or clinical interests are a plus.
